VMware vSphere Converter Standalone is a product to convert Windows and Linux based virtual and physical machines to VMware virtual machines (VM) withoutÂ . I have made the odd post on here before regarding my company, I'm not here to look for work or anything like that but I have a question on the VMware vCenter Converter. Hello, I have this question and I want to solve it. I want to update my VMware vCenter Converter Standalone. How do I download the updated version (From my.rar file) and how do I install it. I've been searching around and I can't find any information about this new version anywhere. I've been using Converter Standalone for a long time, and it was always simply a software version (e.g., "v3.0.3") with new builds coming out on a regular basis. The app would look for a new build and then restart on its own. Of course I could download all of the previous builds and load them one-by-one, but that's a bit cumbersome and labor-intensive (and defeats the purpose of having an app that will automatically check for a new build). I need some new help here, anyone? Thanks. A: I'm having the same issue. I'm trying to reinstall. I've tried to reinstall but VMwareTools was not detected on the installer. The vCenter Converter Standalone version I'm using is 1.3. I have been trying to do this for the past three days and cannot figure it out. I'm not sure if it's because I have a couple of invalid updates to the machine?
